The ultrasonic sensor sends and detects high-frequency ultrasonic sound with a piezoelectric transducer. A part of the reflected sound wave by hitting the measuring surface is detected by the transducer, depending on the speed of the signal in the air, the distance of the objects is determined.When the specified switching point is reached, the output is switched. The measured value is given as analog (0 ... 10 V / 4 ... 20 mA) or CANopen signal.

With ultrasonic sensors, objects can be reliably detected and measured regardless of material, color, transparency and surface properties.

ULS series ultrasonic sensors;
Used in non-contact, level and volume measurement of liquid and solid materials in open and closed tanks.There is also an open canal flow measurement option.It can display the measured value as level, distance (cm, m, inch or feet) or volume (liters, m3, imp, gallons) with 4 sealed membrane keypads.

Measurement Distance and Diameter

| L	OPTIMUM	MINIMUM
	D	
1m	60 cm	60 cm
2m	120 cm	80 cm
3m	180 cm	100 cm
4m	240 cm	110 cm
5m	300 cm	120 cm
6m	360 cm	140 cm
7m	420 cm	160 cm
8m	480 cm	180 cm
9m	540 cm	200 cm

L indicates the mounting height and there should be no obstacle which blocks signals in D width. These values are optimally included in the table above. If optimum dimensions are not followed, level measurement is made, but measurement accuracy decreases.

If it is not possible to install in optimum dimensions, the minimum dimensions must be followed.
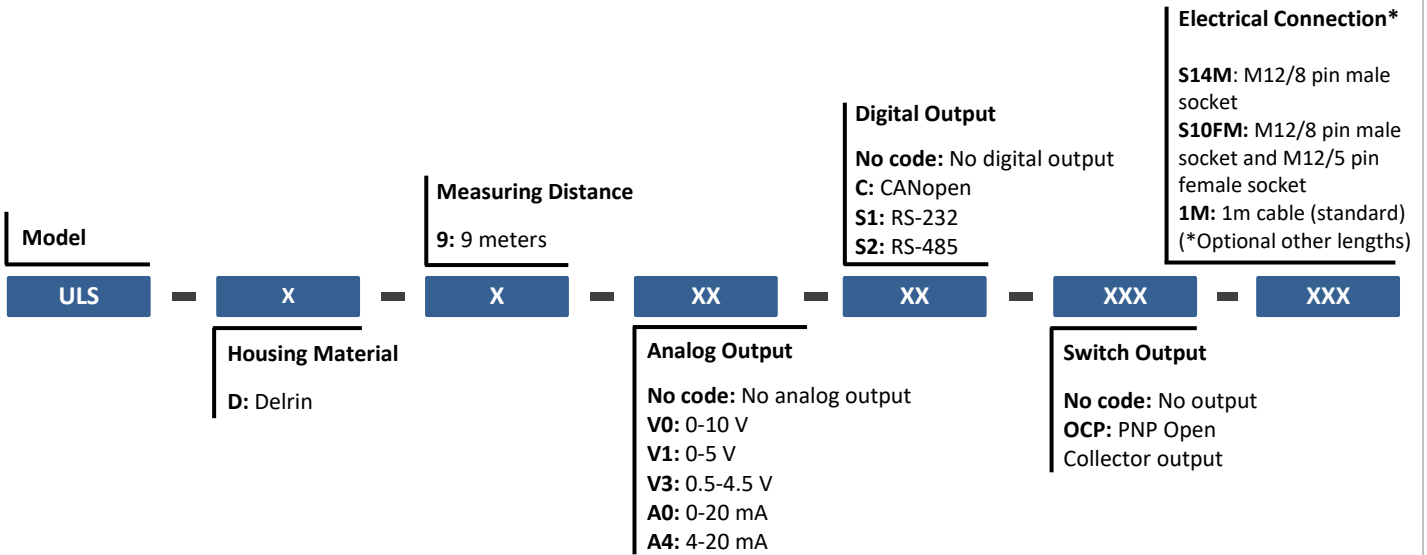

Mounting Warnings
- For level measurement, the sensor must not be installed near the tank input.
- It is recommended that the sensor be protected against sun and rain.
- The sensor must be installed perpendicular to the surface to be measured and should not be placed close to the side surface.
